# Nitrogen Application Timing, Cover Crops, and Water Quality

Assistant Professor Agronomy, Agronomy Department, Purdue University

AGRONOMY

#### Illinois Nutrient Loss Reduction Strategy

The target is a **45 percent reduction** in total phosphorus and nitrate-nitrogen that reaches Illinois waters **by 2025**.

To achieve those goals, we must enhance the efficiency of all common N management practices

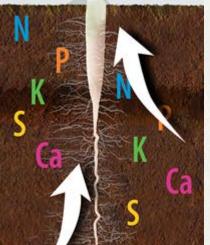

### How do cover crops affect N availability and fate within common N management systems of IL?

#### N Conservation

Inorganic N sources do cover crops interact with:

 Soil inorganic N from OM

- Residual N
- Applied N, if a portion of N is applied in the Fall (DAP or Manure)

#### N Release

Cover crop residue N release depends on:

- Physiology
- Species: Legume, grass, cereal
- C:N ratio

#### N Uptake

Corn and Soybean N and Yield

### Effect of Cover Crops and Nitrogen Application Timing on Nutrient Loading Through Subsurface Drainage

Shalamar Armstrong<sup>1</sup>, Catherine O'Reilly<sup>2</sup>, Richard Roth<sup>3</sup>, Mike Ruffatti<sup>3</sup>, Travis Deppe<sup>3</sup> and Corey Lacey<sup>4</sup>

<sup>1</sup> Assistant Professor, Purdue University Department of Agronomy, <sup>2</sup>Associate Profess of Hydrogeology Department of Geography-Geology, Illinois State University

<sup>3</sup>M.S. Candidate In Agriculture Sciences, Illinois State University Department of Agriculture, <sup>4</sup>Graduate Research Assistant, Purdue University Department of Agronomy

### Nutrient Loss Reduction Strategies Evaluated

1. Change N application timing from fall to spring

2. Change N application timing from <u>fall</u> to <u>spring</u> + <u>cover crop</u>

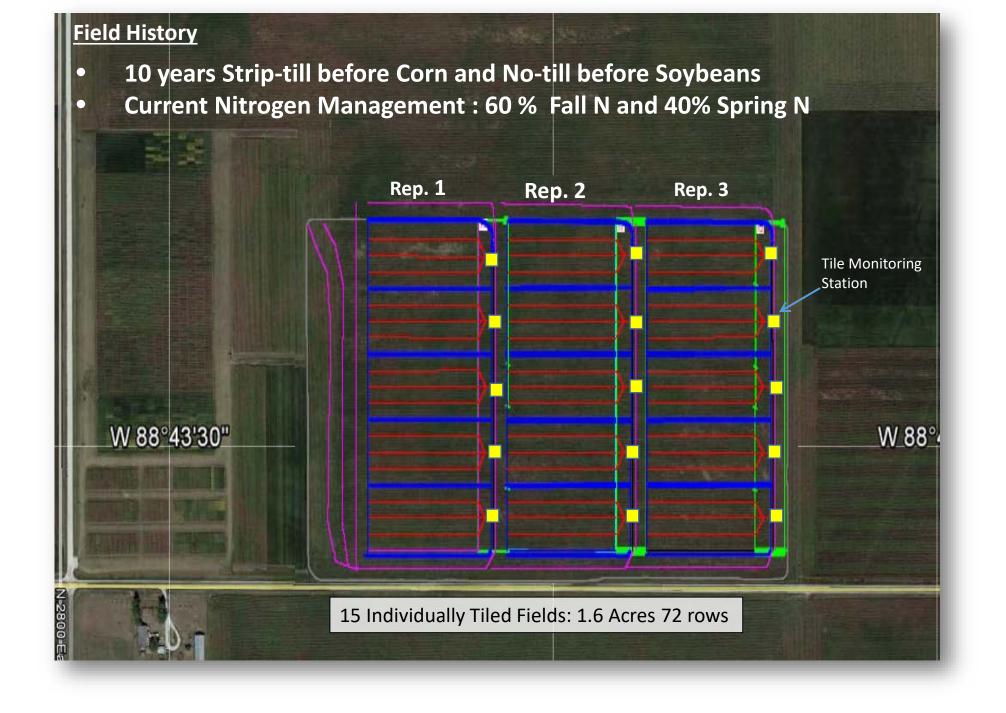

3. Addition of <u>cover crops</u> to <u>fall applied N</u>
----Strip-till application of N into a living cover crop

#### **Treatments**

- 1. Control-No Fertilizer and No Cover crop
- 2. Spring Split Application of Nitrogen (20% Fall -DAP and 80% Anhydrous Ammonium)
- 3. Spring Split Application of Nitrogen (20% Fall-DAP and 80% Anhydrous Ammonium) + <u>Cover</u> <u>Crops</u>
- 4. Fall Split Application of Nitrogen (70% Fall-DAP and Anhydrous Ammonium and 30% sidedress- Anhydrous Ammonium)
- 5. Fall Split Application of Nitrogen (70% Fall-DAP and Anhydrous Ammonium and 30% sidedress- Anhydrous Ammonium) + <u>Cover Crops</u>

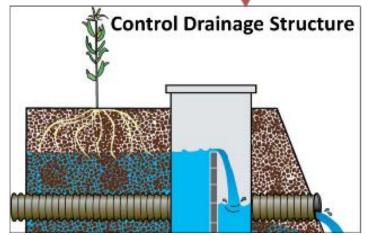

\*Fall Anhydrous Ammonia was strip tilled into a living stand of Cereal and Radish Mix

Total N rate for all plots: 200 lb/A

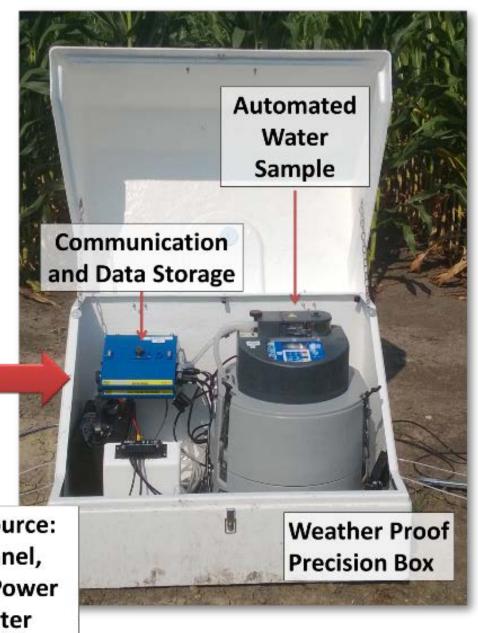

#### Tile Monitoring Station

Power Source: Solar Panel, Battery, Power Converter

#### Methodology – Cover Crop Planting

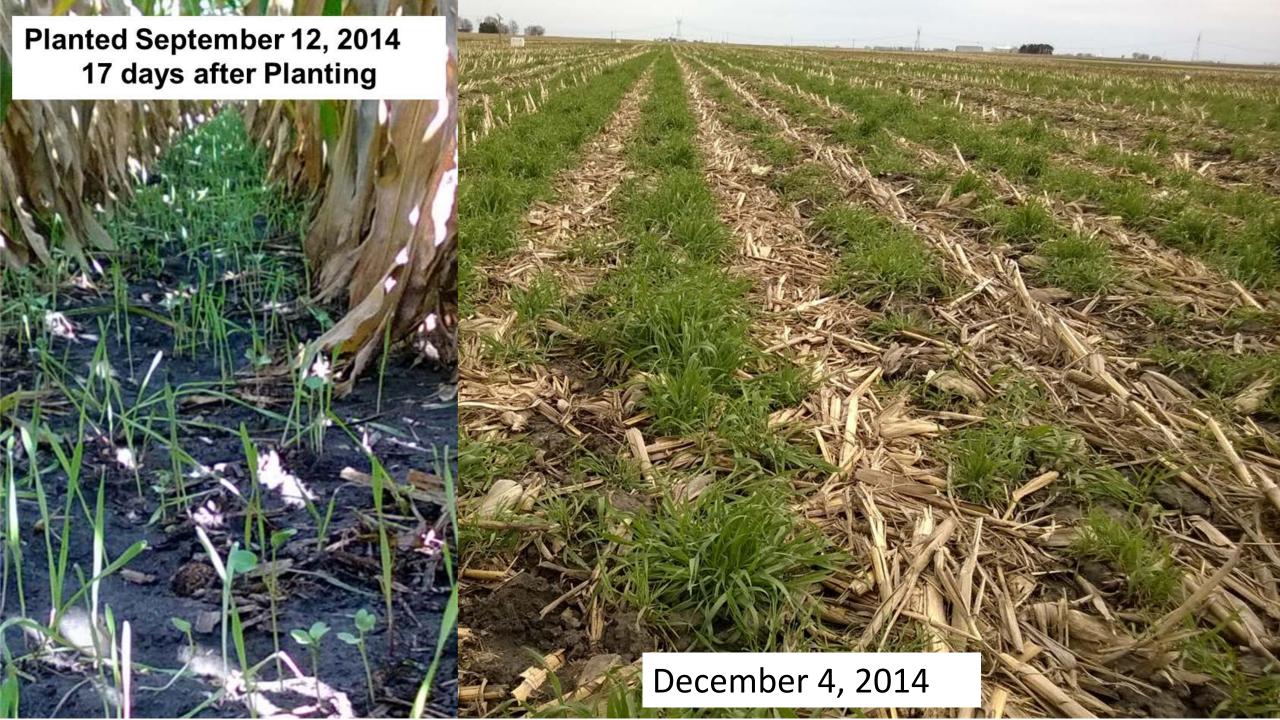

Cover Crop Mixture
Daikon Radish (8%) Cereal Rye
(92%)

Seeding Rate: 84 kg ha<sup>-1</sup>

Planting Date: Early to mid-Sept.

#### Precision Cover Crop and N Management

#### Precision Field Management

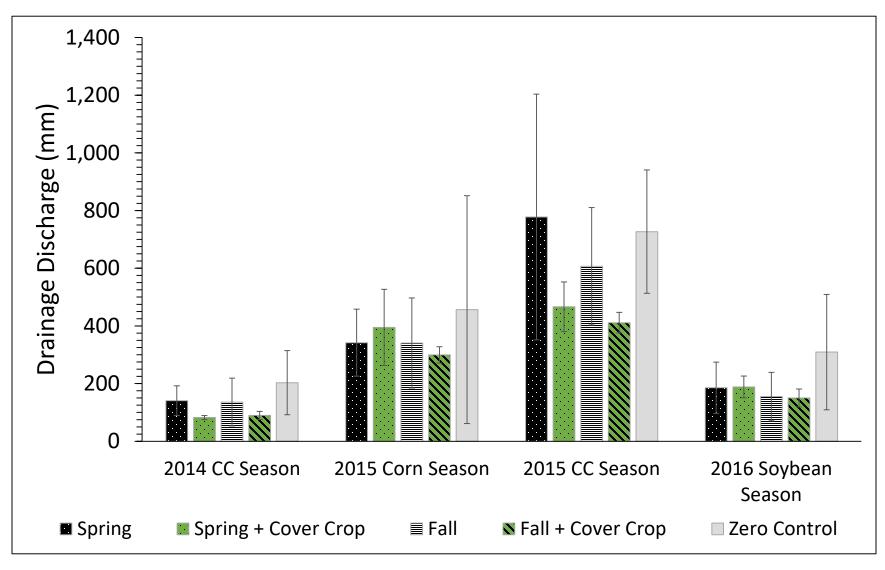

#### Cover Crop Biomass and N Uptake

Sampling Time	Treatment	Average Above Ground Biomass (lb A <sup>-1</sup> )	Average N Uptake (lb A <sup>-1</sup> )
Fall 2014	Fall N + CC	263	10
Fall 2014	Spring N + CC	211	9
Spring 2015	Fall N + CC	936	49
Spring 2015	Spring N + CC	821	36
Fall 2015	Fall N + CC	1224	49
Fall 2015	Spring N + CC	1299	56
Spring 2016	Fall N + CC	1628	54
Spring 2016	Spring N + CC	1941	63

On average, cover crops absorbed 25% (51 lb A<sup>-1</sup>) of the total N rate applied.

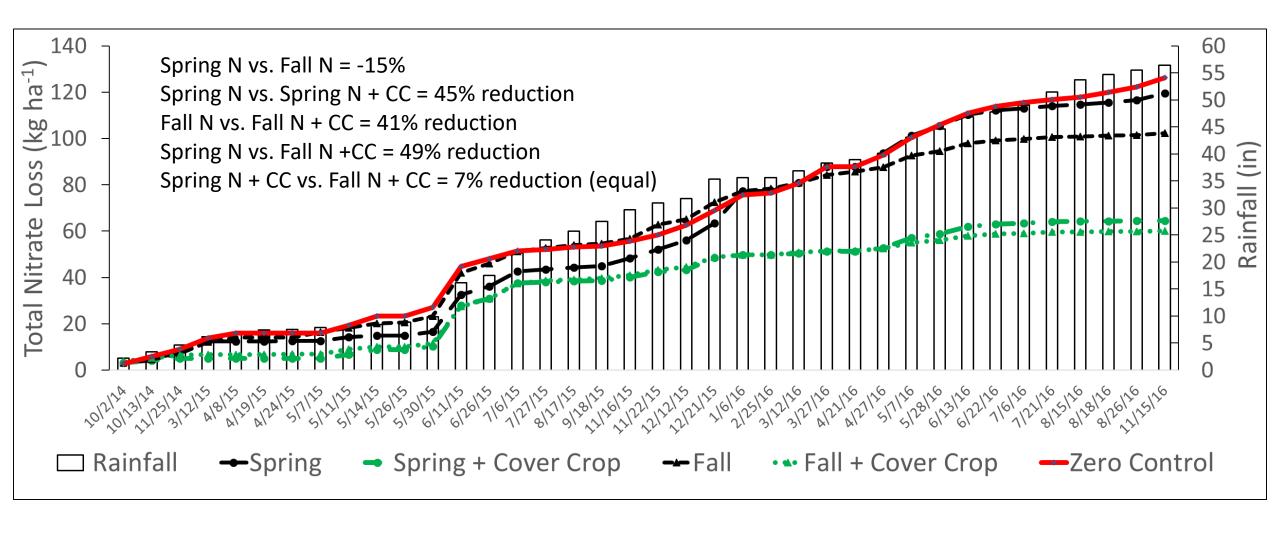

Within the cereal rye/radish mixture, radish is responsible for 55% of biomass produced and 51% of N uptake

### Cover Crops impact on Total Discharge by Season

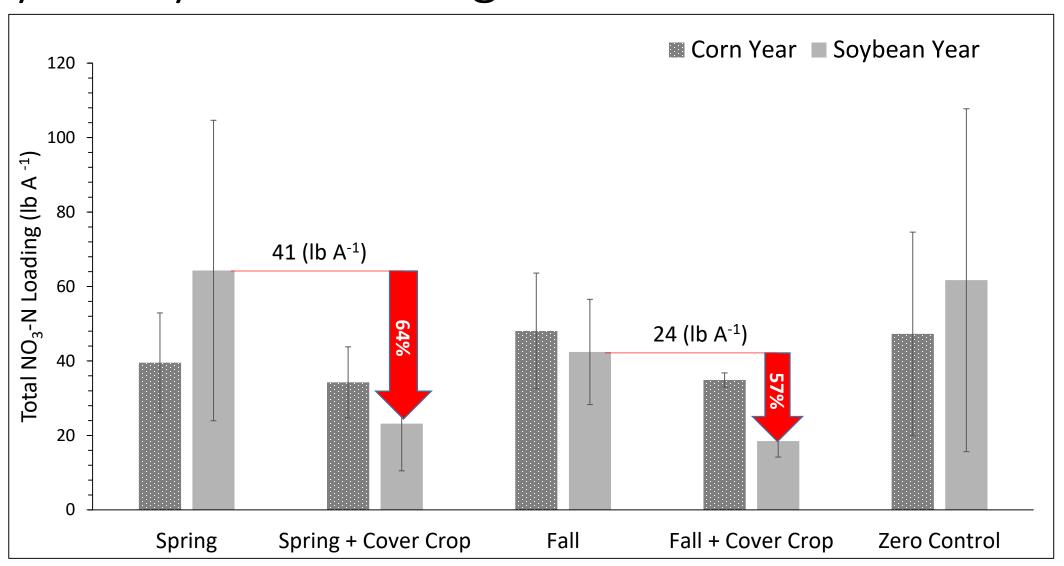

- ➤ 32-42% reduction in drainage during cover crop growing seasons
- Little to no impact of cover crops on discharge during cash crop seasons

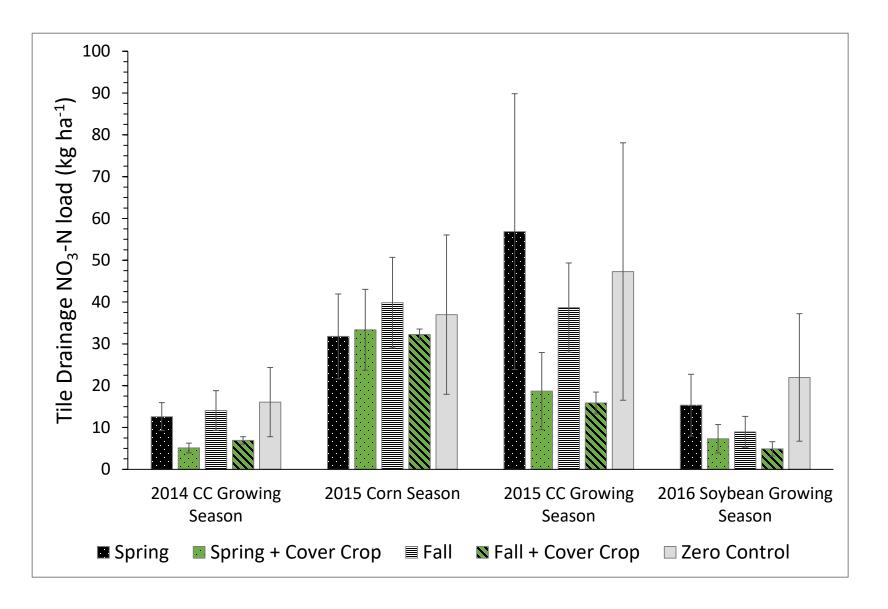

#### Cumulative Rainfall and Nitrate Loading

### Cover crop impact on residual N loading in the soybean year following corn

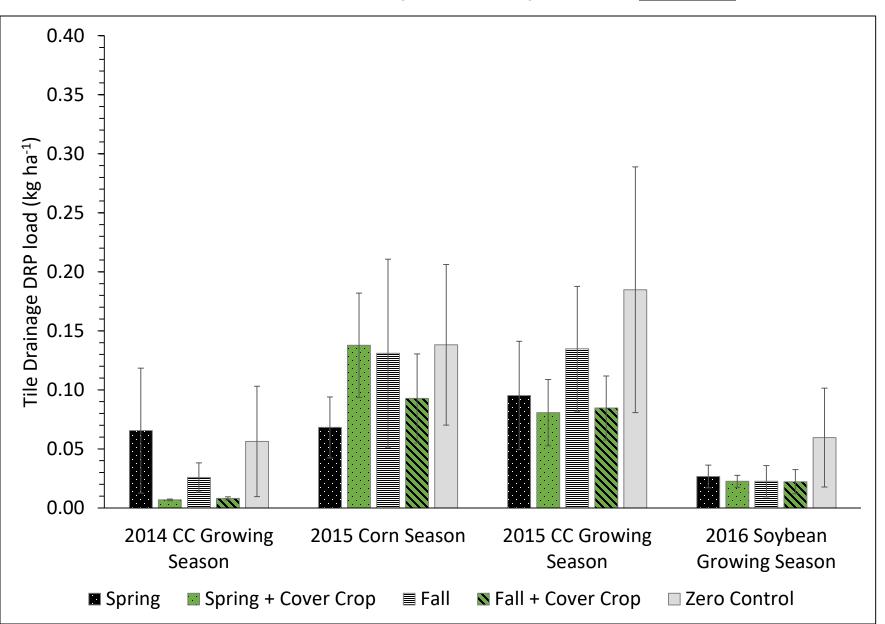

#### Cover Crop Impact on Nitrate Load by Season

- ➤ 51-67% reduction with cover crops <u>during cover</u> crop growing seasons
- ➤ 2015 CC growing season was warm and wet
  - SN vs FN: <u>47%</u> <u>increase</u>

#### Cover Crops Impact <u>DRP</u> Load by Season

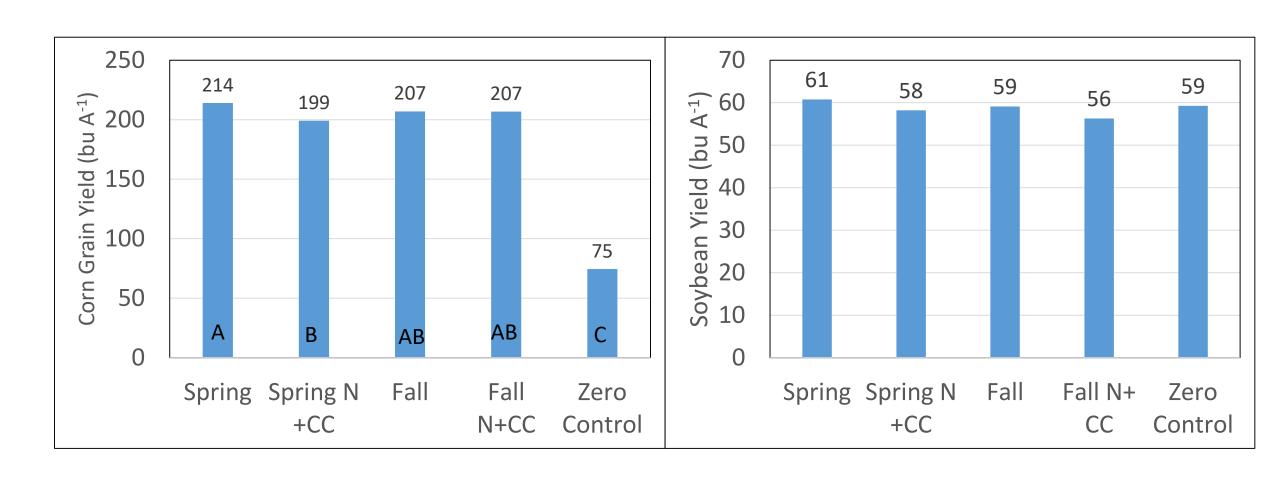

#### **Cover Crop Seasons**

- Spring system: <u>15-90%</u> reduction with cover crops
- Fall system: 37-69% reduction with cover crops

Little to no impact of cover crops on DRP load load during cash crops season

#### Cover Crop Impact on Cash Crop Yield

#### Summary

- On average cover crops stabilized 50 lb N A<sup>-1</sup>
- Despite N management system (Fall or Spring) cover crops reduced N loss via tile drainage by 41-49%. Spring N + CC = Fall N + CC
- Cover crops are most effective when they are growing.

• Cover crops reduced corn N uptake and yield in the spring system, but not in the fall N system.

Cover crops did not impact soybean yield.

### The Effect of Cover Crops on Surface Water Quality: A Paired Watershed Experiment in the Lake Bloomington Watershed

#### Lake Bloomington Watershed Scale

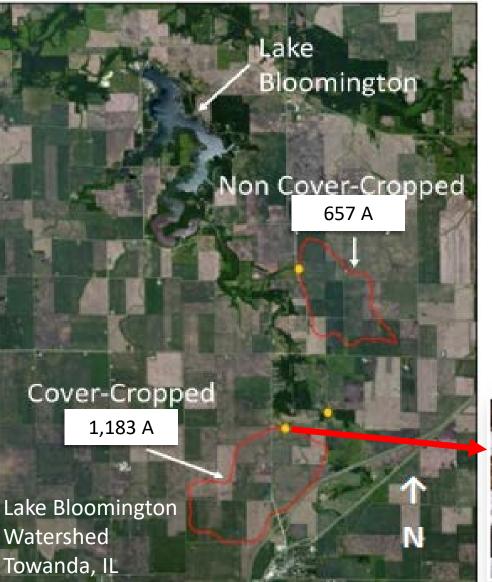

Sampling Site

McClean County

Illinois

Watershed

#### 2016 Control

44% Corn/56% Soybean

#### 2016 Treatment

32% Corn/68%Soybean

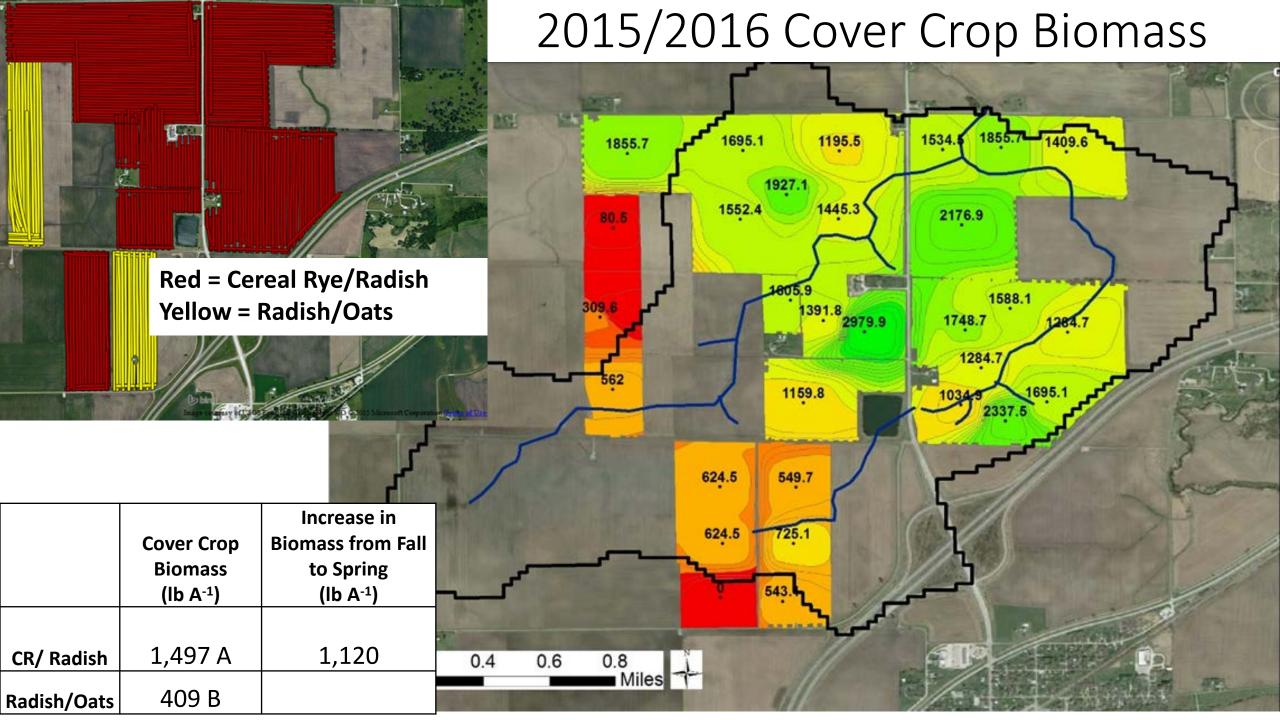

#### Fall and Spring Cover Crop Biomass Samples

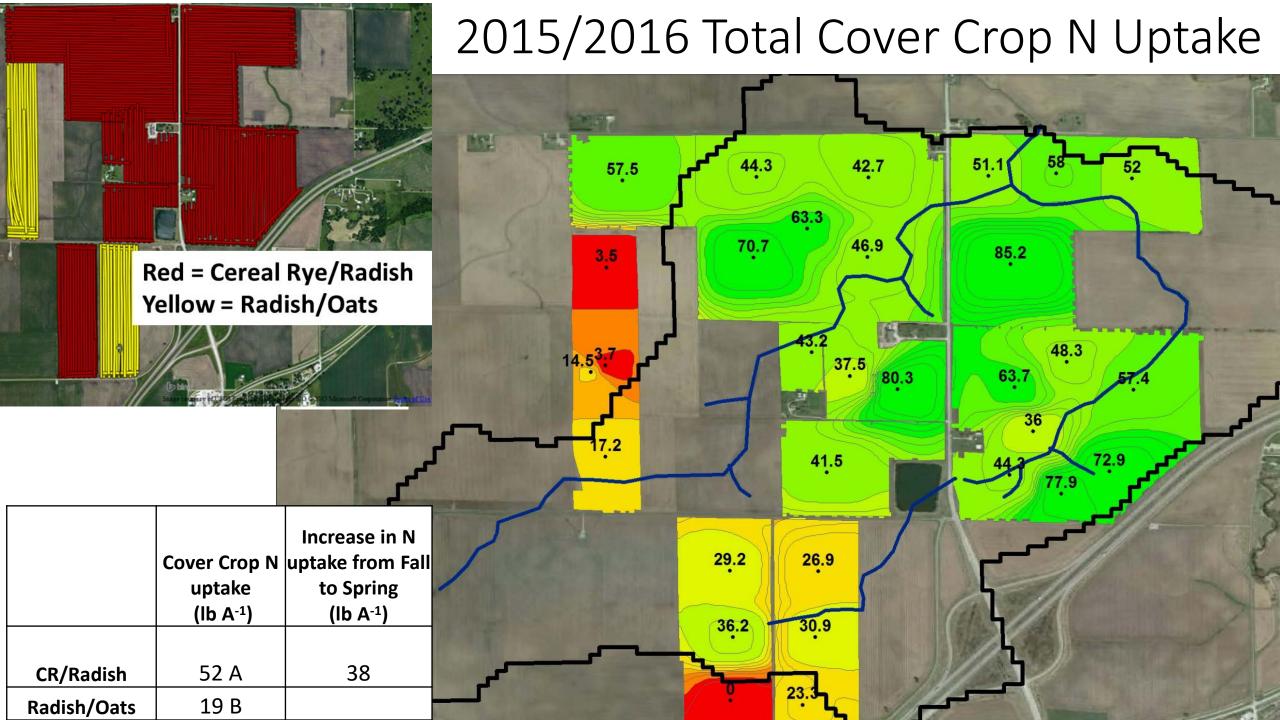

Above ground biomass was collected from a 1 m quadrant from 8 ha grids across the watershed.

*Fall sampling: 11/28/15* 

Spring sampling:4/2/15

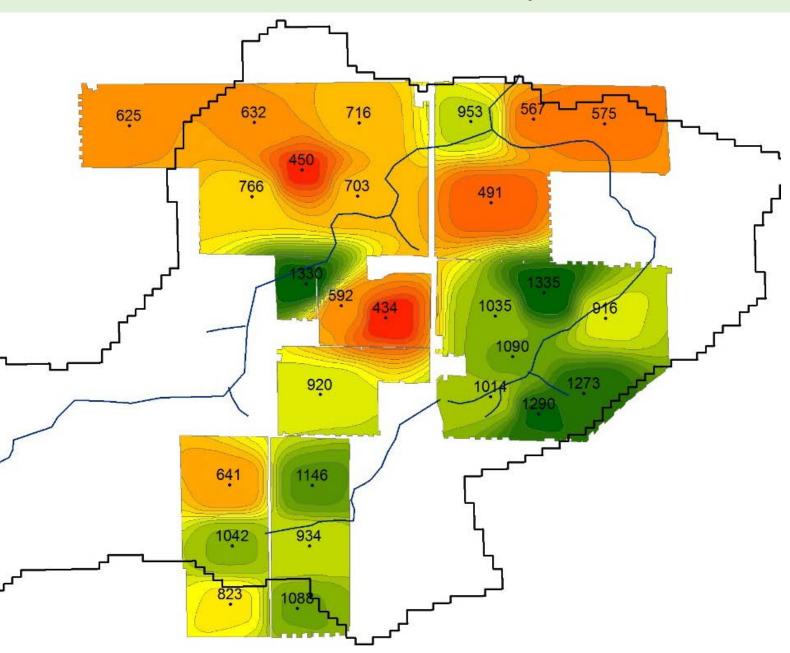

Biomass samples were dried and analyzed for %N to determine cover crop N uptake

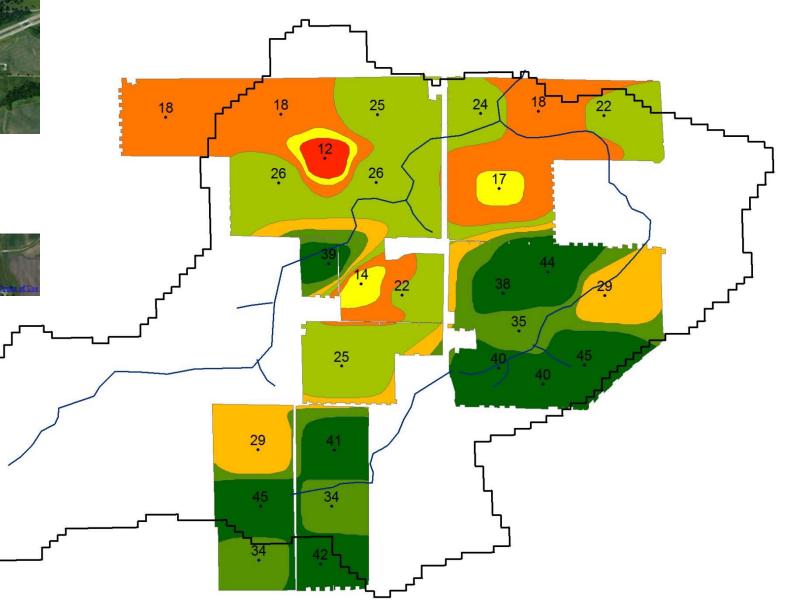

#### Red=Radish/Oats Green=Radish/ Annual Rye Yellow=Cereal Rye/Radish Fall 2016, Cover **Crop Biomass** (lb A<sup>-1</sup>) Radish/Oats 1,034 Cereal 835 Rye/Radish **Annual** 703 Rye/Radish

#### 2016 Fall, Cover Crop Biomass

#### Red=Radish/Oats Green=Radish/ Annual Rye Yellow=Cereal Rye/Radish Fall 2016, Cover **Crop N Uptake** (lb A<sup>-1</sup>) Radish/Oats 37 Cereal 39 Rye/Radish **Annual** 22 Rye/Radish

#### 2016 Fall, Cover Crop N Uptake

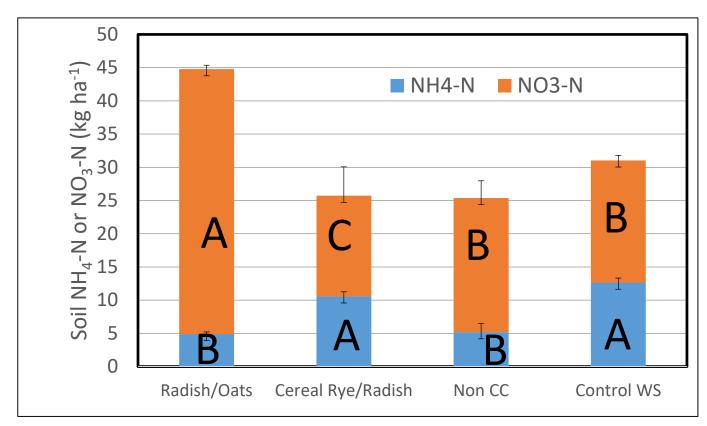

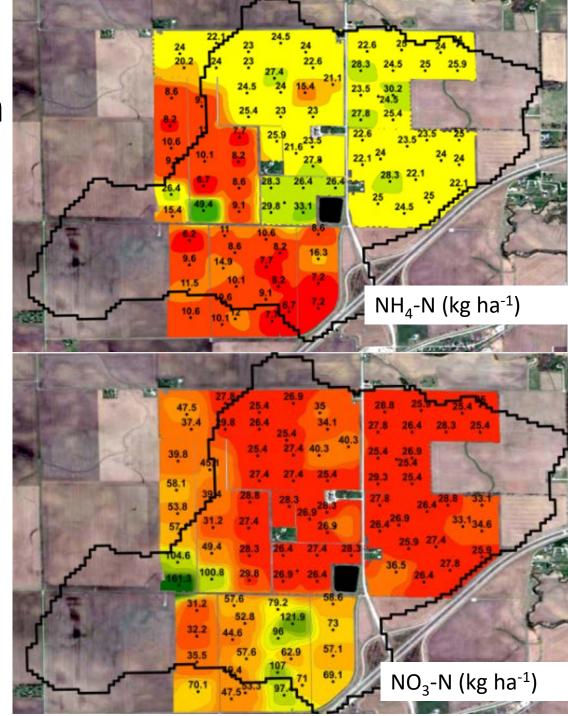

Spring Soil Samples 4/18/16 – 4/21/16

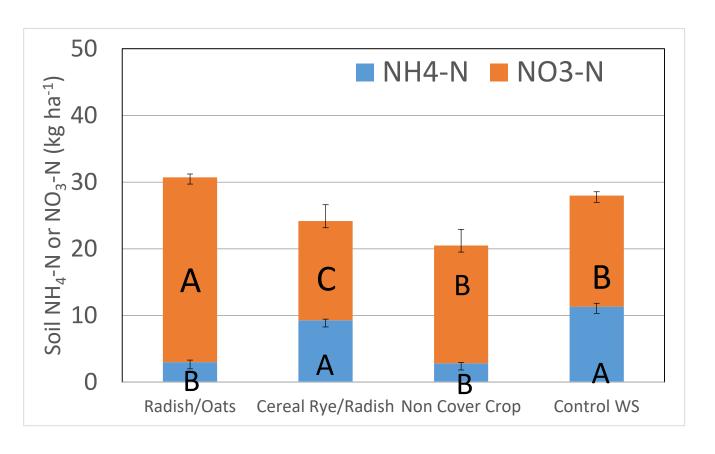

- Soil samples were collected from 0-30 cm and 30-60 cm on 10 A grids across the watershed.
- Soil were analyzed for NO<sub>3</sub>-N and NH<sub>4</sub>-N.

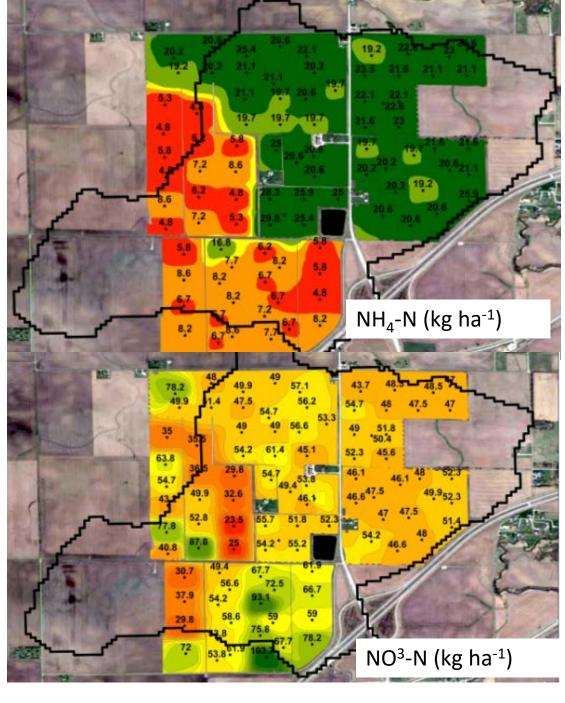

### **Spring 2016**, Soil NH<sub>4</sub>-N and NO<sub>3</sub>-N concentrations at the 0-30cm depth

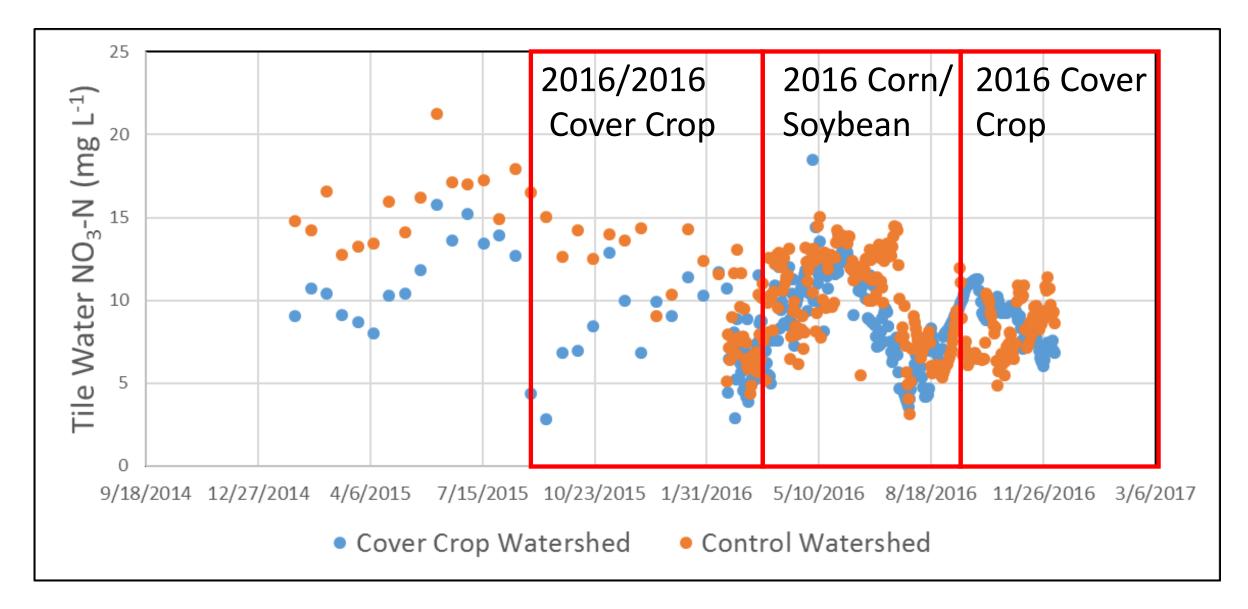

## Spring 2016, Soil $NH_4$ -N and $NO_3$ -N concentrations at the 30-60cm depth

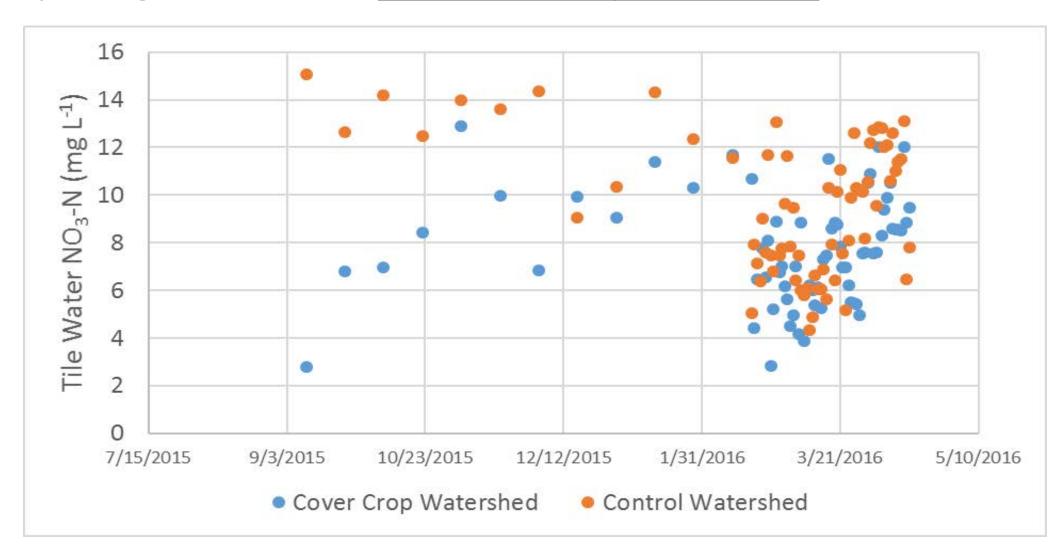

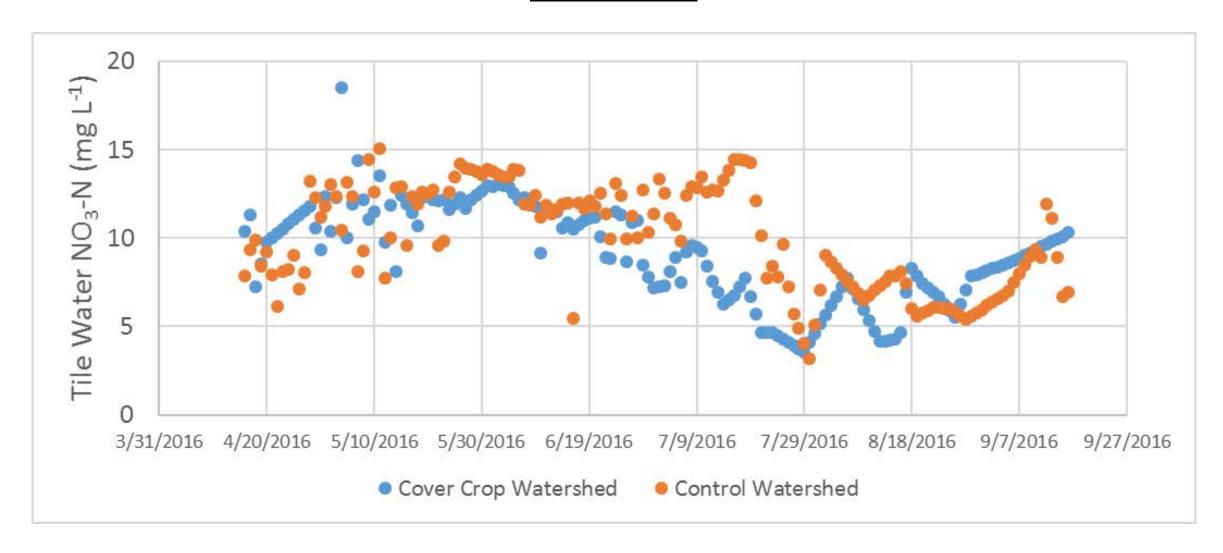

### Cover Crops Impact on Nitrate Loading on a Watershed Scale

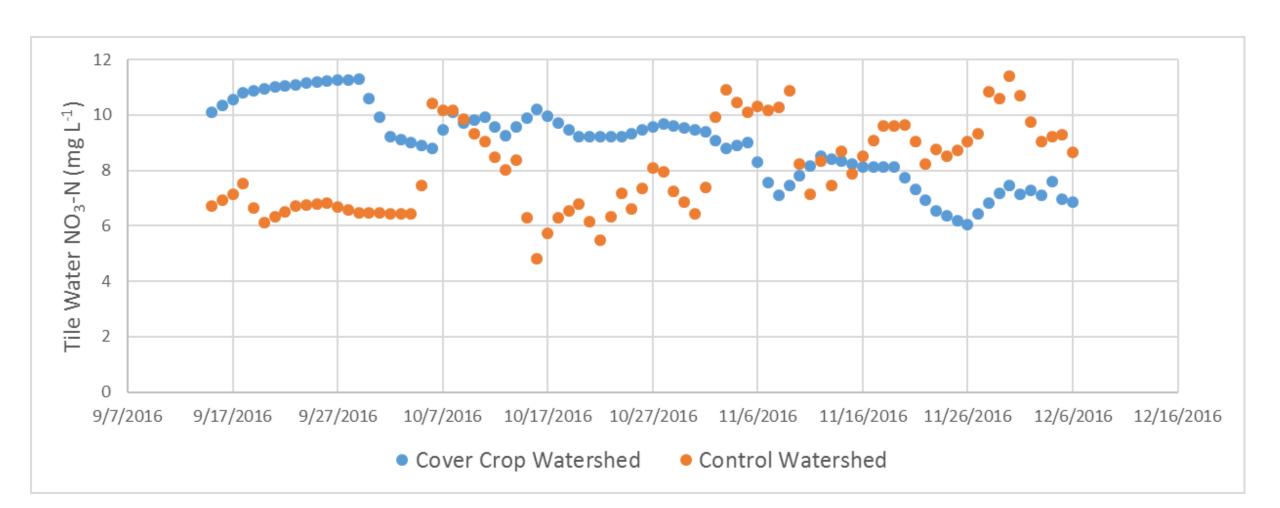

### Nitrate Concentrations During Fall 2015 and Spring of 2016, <u>Cover Crop Season</u>

#### Nitrate Concentrations During 2016 <u>Cash Crop</u> <u>Season</u>

#### Nitrate Concentrations During Fall 2016 <u>Cover</u> <u>Crop Season</u>

#### Summary

- It is possible to cover crop on a watershed level, when you have the cooperation of farmers and industry leaders within the watershed.
- Cover Crops scavenged 21 − 58 kg N ha-1 (19 − 52 lb N A<sup>-1</sup>).
- The type of cover crop planted can dictate the form(NO<sub>3</sub>- or NH<sub>4</sub>+) and location of available N in the soil during the spring after termination.
- During the cover crop growing season, we observed a water quality signal.
   However, during the cash crop growing season additional effective N management practices are need to effect water quality.
